

SQLite Transcriber

SQLite Transcriber is a QGIS plugin that has been designed and tested on QGIS 2.2 and 2.4 for Mac and Windows. The plugin is a tool for coding qualitative data into a Spatialite database. The current version of the tool allows for typing into the textbox location, or loading an existing .txt file.

The purpose for the tool is to allow for a means to code qualitative data into a Spatialite database. Users can transcribe interviews or audio/video clips from focus groups into the plugin. Other options include copying text from documents into the plugin for coding purposes. Users identify a Spatialite database, table and column to submit codes. Codes are submitted to the database by highlighting the word(s) of interest and pressing the *Add Selection* button, or click the keyboard short cut *command + d* (Mac) and *ctrl+d* (Windows). The plugin is accessed and used within QGIS. The following are screen shots and examples of usage. As a note, the plugin will work with Mac Dictation, which will allow for audio clips of speech to be transformed into text directly into the tool.

SQLite Transcriber can be access from the Plugins menu, or via the icon (see Figure 1 and Figure 2).
